Definitions

Metro Areas

The United States Office of Management and Budget (OMB) defines metropolitan areas (metro areas) according to published standards that are applied to Census Bureau data. The general concept of a metro area is that of a core area containing a large population nucleus, together with adjacent communities having a high degree of economic and social integration with that core. Currently defined metro areas are based on application of 1990 standards (which appeared in the Federal Register on March 30, 1990) to 1990 decennial census data and to subsequent Census Bureau population estimates and special census data. Current metro area definitions were announced by OMB effective June 30, 1999.

The current standards provide that each newly qualifying metro area must include at least:

- One city with 50,000 or more inhabitants, or
- A Census-bureau defined urbanized area (of at least 50,000 inhabitants) and a total metropolitan population of at least 100,000 (75,000 in New England). Under the standards, the county (or counties) that contains the largest city becomes the “central county” (counties), along with any adjacent counties that have at least 50% of their population in the urbanized area surrounding the largest city. Additional “outlying counties” are included in the metro area if they meet specified requirements of commuting to the central counties and other selected requirements of metropolitan character (such as population density and percent urban).

The OMB defines NECMAs as a county-based alternative to the city- and town-based New England MSAs. The NECMA defined for an MSA includes:

- all of the counties in the MSA for which at least half of the county is part of the MSA

As of June 1999, according to OMB definitions, there were 306 MSAs in the United States outside of New England, and 12 NECMAs within New England.

DRI-WEFA creates a 319th metro area by dividing the Boston, MA-NH NECMA along the MA/NH border into Boston, MA and Manchester, NH.

A full list of the metropolitan areas and their county-based definitions is available on the Internet at:

Concentration Ratio

The concentration ratio (also commonly referred to as location quotient) measures the relative importance of a given economic sector to a metro area. It is derived by taking the ratio of the share of the industry for the particular metro versus the average share of the industry over all US metro areas. Thus if a percentage share for a particular industry was 5% and the metro had 15% of its employment in that particular industry, its concentration ratio would be 3. A high ratio signifies that particular industry is far more important to the metro as it contains a significant portion of the metro's employment and its density is such that we can with confidence say the metro has developed a "cluster" within that sector. Clusters are of singular importance to industries as they contain and deliver networked effects on the industry and produce the positive externality observed in clustered industries.

Measures of Total Economic Activity

Entire United States – GDP

Individual State – GSP

Metropolitan Area – GMP

Gross State Product (GSP) is the value added in production by the labor and property located in a state. GSP for a State is derived as the sum of the gross state product originating in all industries in a State. However, users cannot add up the 50 State's GSP to reach National GDP.

Gross Metro Product (GMP) is the metro-area equivalent of GSP. GMP is derived from the state GSP data using a formula developed by Global Insight.

Users can add up all the cities of a state plus the remainder of the state to find the state's GSP. GMP for the sum of metros and the remainder of metros is identically equal to the BEA's GSP for the state of Michigan. GMP, both historically and in all Global Insight Forecasts always add up to equal the GSP for the State.

For more information go to the BEA's web site at <http://www.bea.gov/bea/regional/data.htm>

Industries Included in the Residential Housing Market

Natural Resources

- Forestry

Construction

- Residential Building Construction
- Plumbing, Heating, Air-Conditioning
- Electrical Work
- Painting and Paper Hanging
- Masonry, Stonework, and Plastering
- Carpentry and Floor Work
- Roofing, Siding, and Sheet Metal Work

Manufacturing

- Millwork, Plywood & Structural Members
- Wood Buildings and Mobile Homes

Finance

- Real Estate Operators and Lessors
- Real Estate Agents and Managers
- Title Abstract Offices

Affordability Index

A value of 100 means that a family with the median income has exactly enough income to qualify for a mortgage on a median-priced home. An index above 100 signifies that family earning the median income has more than enough income to qualify for a mortgage loan on a median-priced home, assuming a 20% down payment. For example, a composite HAI of 120.0 means a family earning the median family income has 120% of the income necessary to qualify for a conventional loan covering 80% of a median-priced existing single-family home. An increase in the HAI, then, shows that this family is more able to afford a median-priced home.

Another way to think of this calculation is to ascertain how much of the household income is devoted to the monthly mortgage payment. Ideally, the amount should be 28% in order to have a HAI of 100. If the HAI is lower than 100, that indicates more than 28% of household income is needed to service the payment; if the HAI is higher than 100, less than 28% of household income is necessary.

HAI	% of Household Income needed to pay mortgage
90	31.1%
100	28.0%
200	14.0%
400	7.0%

Note: This % of household income only refers to those existing houses that are sold and current interest rates; it cannot be used to determine an average payment for total housing stock.
